CS 1541 Introduction

Instructor Introduction

Course Introduction

Wonsun Ahn
Department of Computer Science
School of Computing and Information

Instructor Introduction

My Technical Background

- Wonsun Ahn
  - First name is pronounced *one-sun* (if you can manage)
  - Or you can just call me Dr. Ahn (rhymes with *naan*)
- PhD in CPU Design and Compilers
  - University of Illinois at Urbana Champaign
- Industry Experience
  - Software engineer, field engineer, technical lead, manager
  - Bluebird Corporation (70-person startup company)
    - Manufactures industrial hand-held devices from top to bottom
    - Me: Built software stack based on Windows Embedded
  - IBM Research (thousands of people)
    - Does next-gen stuff like carbon nanotubes, quantum computers
    - Me: Designed supercomputers for ease of parallel programming

My World View

- Everything is connected
  - Pandemic: If my neighbors catch the virus, so will I
  - Environment: If my neighbors pollute, I will feel the effects
  - Economy: Think of how the subprime mortgage crisis spread
- Zero-sum thinking (old way of thinking)
  - “If you get a larger slice of the pie, I get a smaller slice.”
  - Therefore, if you lose, I win (and vice versa)
- Zero-sum thinking no longer works
  - If you catch the virus, do I become safer from the virus?
- Collaboration is replacing competition

Collaboration is Replacing Competition

- Is happening in all spheres of life
- Collaboration is also happening in the IT industry
  - The *open source* movement
  - Increasing importance of the software/hardware *ecosystem*
  - Increasing importance of the developer *community*
- Collaboration is also important for learning
  - During my undergrad years, what do I remember best?
  - Stuff that I explained to my classmates
  - Stuff that my classmates taught me

Supporting Collaborative Learning

- I *do not* grade on a curve
  - You will not be competing against your classmates
  - You are graded on your own work on an absolute scale

- You will be a member of a Team
  - You are already a member of the class on Microsoft Teams
  - I encourage you to be on Teams at most times (I will too)
    - You can install app on both laptop and cell phone
  - If you have a question, you can ask in the Team “Posts” tab
    - Either your classmate or your instructor will answer
  - You can chat with any individual on the Team
    - “Manage Team” item in the “…” Team context menu

Supporting Collaborative Learning

- You will be a member of a Group
  - On Teams, you will be part of a chat group of 8 members
  - Your instructor is also a member of each Group
  - It is a smaller support group where you can talk more freely
- You are allowed to discuss TopHat lecture questions
  - The goal is no-student-left-behind
  - Discuss answers on Teams even before submitting them
  - Form a basis of knowledge for doing homeworks and exams

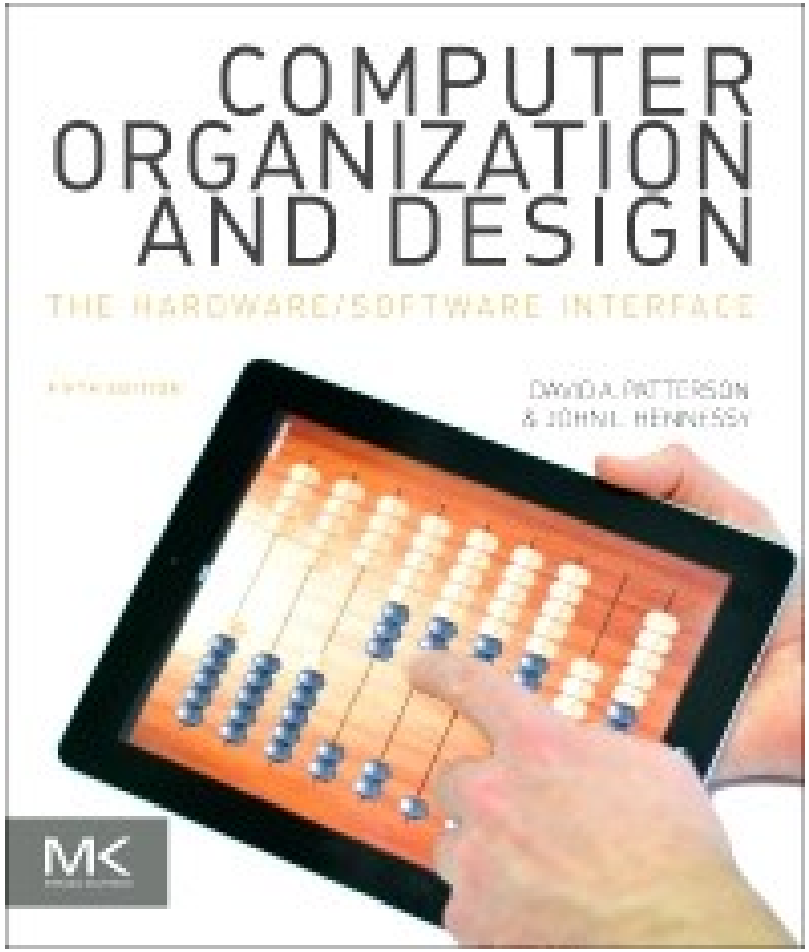
Course Introduction

Structure of the Course

- (45% of grade) Two midterms
- (20% of grade) Two projects
  - Implementing a CPU simulator using C programming language
- (20% of grade) Four homeworks
- (15% of grade) Participation
  - Attendance, TopHat lecture questions, Teams participation
- Class resources:
  - Canvas: announcements, Zoom meetings, recorded lectures
  - GitHub: syllabus, lectures, homeworks, projects
  - Tophat: online lecture questions
  - GradeScope: homework / projects submission, grading and feedback
  - Microsoft Teams: all out-of-class communication

Textbook (You Probably Have it)

- "Computer Organization and Design - The Hardware/Software Interface" by David Patterson and John Hennessy Fifth Edition - Morgan & Kaufmann.



For More Details

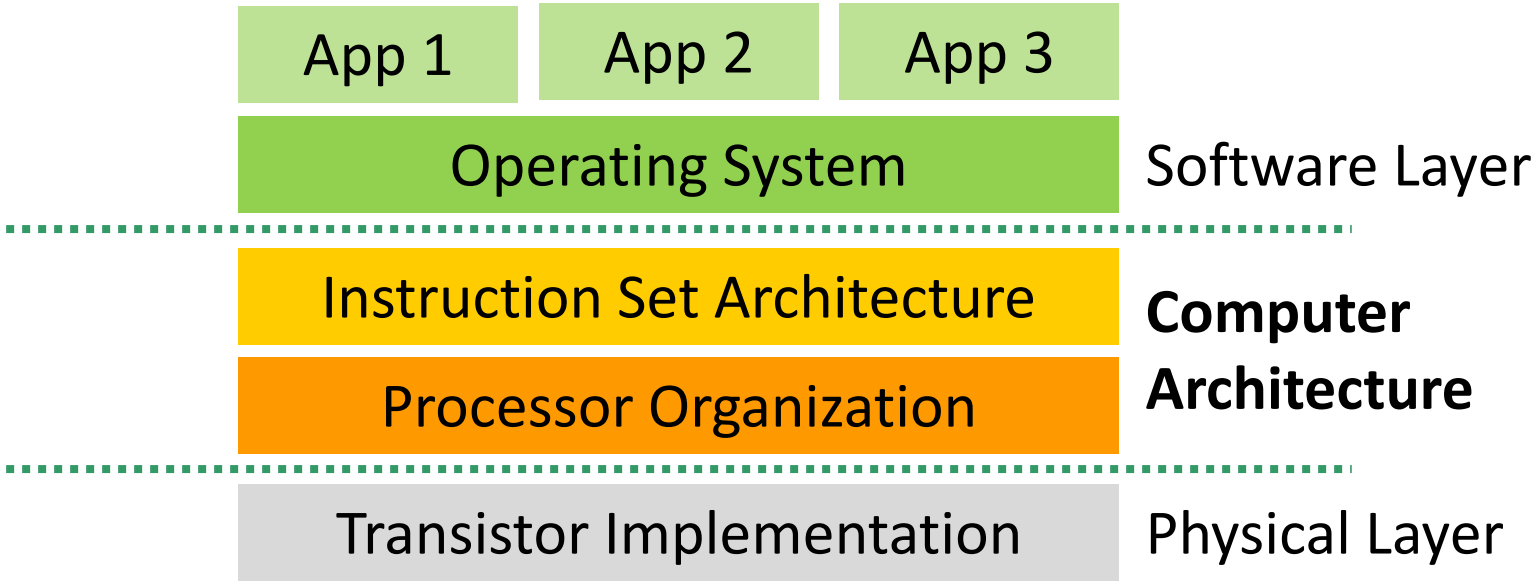
- Please refer to the course info page: https://github.com/wonsunahn/CS1541_Spring2022/blob/main/course-info.md

- Please follow the course syllabus schedule: https://github.com/wonsunahn/CS1541_Spring2022/blob/main/syllabus.md

What is Computer Architecture?

- At a high-level: how a computer is built
  - Computer here meaning the processor (CPU)
- You probably heard of a similar term before: ISA
  - ISA (Instruction Set Architecture)
- Review: what is defined by an ISA?
  - *Set of instructions* usable by the computer
  - *Set of registers* available in the computer
  - Other functional attributes
- What is *not* defined by an ISA?
  - *Speed* of computer
  - *Energy efficiency* of computer
  - *Reliability* of computer
  - Other performance attributes

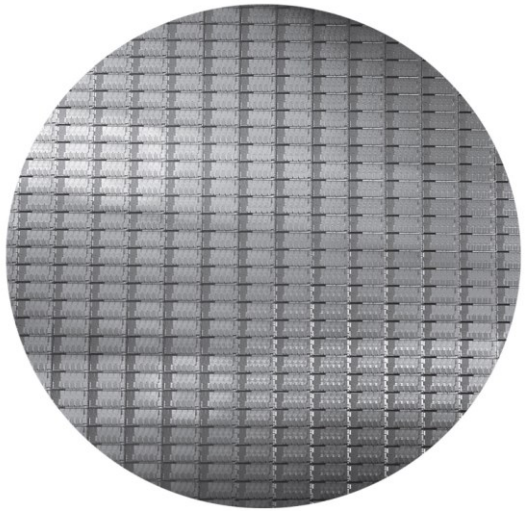
Computer Architecture Defined



- Computer Architecture = ISA + Processor Organization
  - Processor organization is also called *Microarchitecture*
- Given an ISA, performance is decided by:
  - Processor organization (internal design of the processor)
  - Transistor implementation (semiconductor technology)

Scope of Class

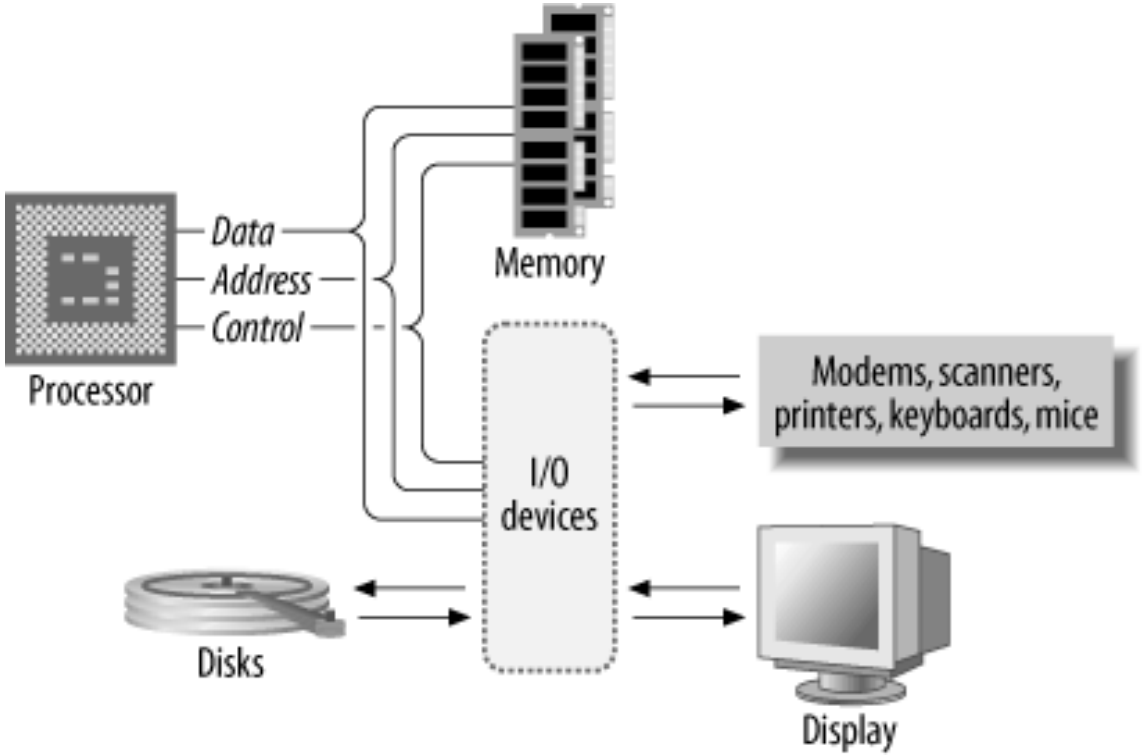
- Physical layer is beyond the scope of the class



- We will focus mostly on processor organization
  - And how performance goals are achieved

Scope of Class

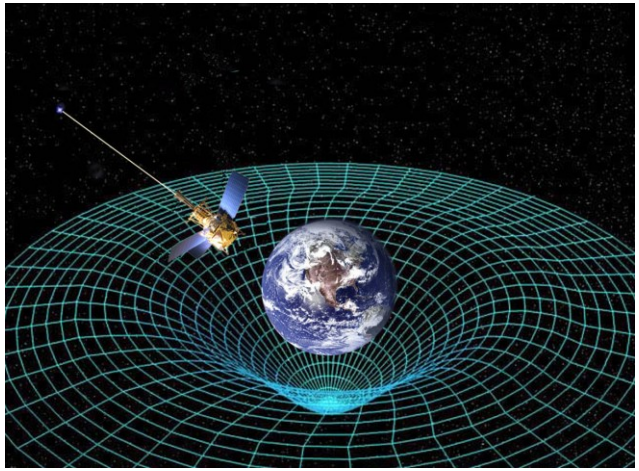
- Computer architecture is part of system architecture



- Other components beside processor is beyond the scope

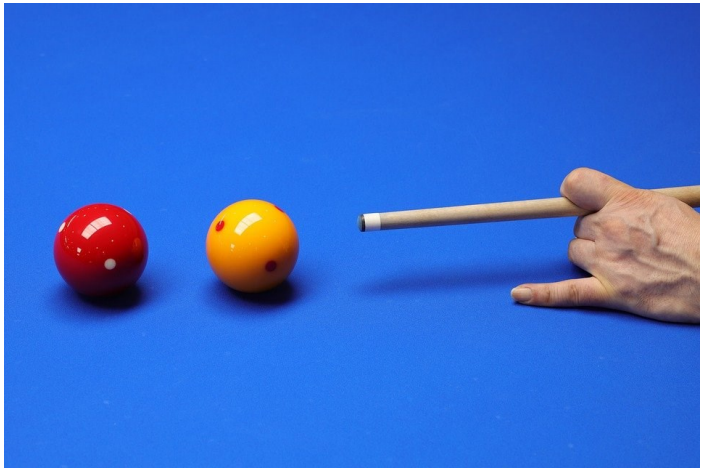
Two Forces on Computer Architecture

1. Application pull



- Market forces pull architecture towards popular applications

2. Technology push



- Advances in silicon technology push architecture to change

Application Pull

- Different applications pull in different directions

  - Real-time app (e.g. Game): *Short latency*
  - Server app: *High throughput*
  - Mobile app: *High energy-efficiency* (battery life)
  - Mission critical app: *High reliability*
- An app typically has multiple goals that are important

Application Pull

- Some goals can be incompatible
  - E.g. Speed and energy-efficiency are incompatible
    - Running is faster than walking but uses more energy
    - A Ferrari is faster than a Prius but has worse fuel efficiency
  - E.g. Reliability is incompatible with many other goals
    - If you use redundancy, you use twice the amount of energy
- Even when sharing a goal, apps have unique needs
  - Scientific apps need lots of *floating point units* to go fast
  - Database apps need lots of *memory cache* to go fast
- An architecture is a compromise among all the apps
  - When app achieves market critical mass, designs diverge (Mobile chips / Server chips / GPUs / TPUs diverged)
  - Sometimes even ISAs diverge (GPUs and TPUs)

Technology Push

- Trends in technology pushes architecture too

  - Trends can be *advances* in technology
  - Trends can be *constraints* technology couldn't overcome
- "Technology" in CPU design refers to the physical layer
  - Manufacturing technology used for transistor implementation
